

ABSTRACT OF THE INVENTION

A portable device that includes a microcomputer having a housing with an operating system, a screen and a keypad with at least control keys. The portable device includes a connector socket for connecting a separate cartridge to interface the program on the cartridge to the operating system. The cartridge housing is made with an additional connector for setting an additional cartridge into it. When the additional cartridge is connected, applications on the additional cartridge may also be run by the microcomputer via the first cartridge without having to disconnect the first cartridge.
